PROFESSIONAL SUMMARY

AI Software Engineer with an Information Systems Engineering degree. Builds production AI agents, RAG, web/mobile products and DeFi integrations. Combines product architecture and design systems with backend scale: contributed to a historical load of **20M+ promotions** and built a back office integrating **10+ enterprise systems**.

PROFESSIONAL EXPERIENCE

AI Engineer | Rampy

Sep 2026 - Present | United States · Remote

AI Engineer · end-to-end product engineering · Work directly with three founders to ship AI, fintech, web and mobile features through architecture, delivery and operations.

- **Built a consolidated portfolio and 24-hour returns view** with parallel calls, prefetching and Redis caching; comparable vault, market and perpetual queries moved from seconds to milliseconds.
- **Built Agno, LangChain/LangGraph and OpenAI API agent workflows with Neo4j GraphRAG**, improving memory, retrieval, tool selection and evaluation. Optimized flows responded at least 2× faster by owner estimate; removing redundant calls cut tokens in affected queries by an estimated 30%.
- **Integrated Morpho, Aave, and Compound end to end** for positions, yields, deposits, and withdrawals across backend, frontend, and transaction execution, with completeness checks and webhook-based status tracking; also worked with Privy and Stripe integrations in production.
- **Refactored the full backend into hexagonal architecture and the React/Next.js frontend by user feature**; built Rampy's complete design system with reusable component abstractions, all in production. Implemented E2EE for user conversations with encrypted database storage.
- **Shipped React Native, Kotlin and Swift mobile features** using Android Studio; cut measured average app startup from about 7-8 s to 1-2 s. Implemented end-to-end event tracking with Firebase Analytics, Clarity Mobile on every screen, Singular SDK and Meta App Events, avoiding duplicates.
- **Cut validation, build and deployment from about 1 hour to 10 minutes** while retaining checks; prepared DigitalOcean environments and monitoring for growth.

Software Engineer | Teamcubation

Dec 2025 - Aug 2026 | Argentina · Remote

Payway promotions platform: contributed to a production historical load of **20M+ promotions** plus thousands of new promotions daily, in a 13-country ecosystem.

- **Delivered the promotions experience end to end**: connected a Single-SPA React/TypeScript microfrontend to Java/Spring Boot and Node.js/NestJS microservices through a Spring WebFlux BFF; Amazon API Gateway bridged the HTTPS portal to internal HTTP services.
- Built a merchant-facing **GraphRAG agent and harness with Neo4j and OpenAI API** to relate enterprise policies and promotions, orchestrate agents, evaluate answers, tune performance and enforce promotion-domain and data-leakage guardrails. The assistant answered queries without executing commercial actions.

- **Built Java/Spring Boot and TypeScript/Node.js/NestJS microservices** using hexagonal or layered architecture, and developed and diagnosed containerized workloads running in Docker/Kubernetes-managed environments.
- **Implemented event-driven processing** with S3, SQS, and a Python/FastAPI Lambda for the historical load; built Python/Node.js tooling to reproduce local loads, reconcile results, and identify failed promotions.
- **Created a custom agentic engineering workspace** for the product's multi-repository integration landscape to streamline context retrieval, token usage, and consistent feature delivery.

AI Engineer & Full-Stack Developer | Self Employed

Jan 2024 - Present | Argentina · Remote

Independent Product Engineering · Revenue-generating products, internal operations systems, and AI automation for e-commerce, social media, and digital-product clients.

- **Designed and shipped digital products**, back offices, and stock/point-of-sale extensions that generated **USD 10,000+ in cumulative client profit**, connecting commercial needs with maintainable, scalable operations.
- **Built MCP-, Claude-, and LLM-powered pipelines and agents** for end-to-end content research, generation, and publishing; clients estimated operating-cost reductions of at least **70%**.
- **Built stores, APIs, and Python/Node.js automation** using Spec-Driven Development, cutting tasks from hours to minutes. For Pequeverso, delivered a Next.js site on Hostinger and an informational product and shopping assistant.

Software Engineer | Cooperativa Obrera

Dec 2024 - Dec 2025 | Bahía Blanca, Argentina · On-site

Permissions Management System · Principal design, architecture, and implementation of a back office for authorized personnel at an organization with **150+ branches, 2.7M+ members**, and 50+ internal systems.

- **Built a responsive, dynamic Next.js/TypeScript frontend** connected exclusively to a Python/FastAPI BFF, standardizing frontend views against its contract and integrations with Java/Spring Boot, Node.js/NestJS and PHP services through OpenAPI/Swagger.
- **Integrated 10+ systems** through Java/Spring Boot and TypeScript/Node.js/NestJS microservices with different databases and permission models behind a consistent admin UI; used an agentic workspace to preserve context across repositories.
- **Standardized system onboarding** with reusable structures, filters, and validation, reducing permission-related tickets and manual assignments by at least **80%** and eliminating at least **95%** of recurring assignment bugs, based on before/after tickets and logs.
- **Automated permission lookups that previously took about 10 minutes of manual work, bringing them under 10 seconds** through the integrated back office, SQL tuning, indexing, and pagination. Critical endpoints averaged under **300 ms** in tests on enterprise on-premise servers.
- **Implemented LDAP, RBAC, and exportable auditing** to restrict access to authorized personnel; automated Python validation and bulk loads for a MySQL/MariaDB and Redis system subsequently maintained by the web team.

TECHNICAL SKILLS

Applied AI & Agentic Systems: AI Agents, RAG, GraphRAG, Agno, LangChain, LangGraph, Mem0, LLM Evaluation, Model Context Protocol (MCP), pgvector, Neo4j, AI Guardrails, OpenAI API, Claude API

Backend & APIs: Spring Boot, FastAPI, NestJS, Spring WebFlux, Spring Security, Laravel, REST APIs, Microservices, Celery, OpenAPI

Languages & Runtimes: Python, TypeScript, Java, JavaScript, Node.js, SQL, Kotlin, Swift, PHP

Web & Mobile: React, Next.js, React Native, Android Studio, Design Systems

Data & Architecture: PostgreSQL, MySQL, MariaDB, Redis, Hexagonal Architecture, Event-Driven Architecture, SQL Tuning

Cloud & Delivery: DigitalOcean, AWS Lambda, Amazon API Gateway, Amazon S3, Amazon SQS, Docker, Kubernetes, GitLab CI/CD, GitHub Actions

Quality, Delivery & Observability: JUnit, Mockito, SonarQube, OpenTelemetry, Prometheus, Grafana, RBAC, LDAP, Application Security, End-to-End Encryption, Infishal

Fintech & DeFi Integrations: Fintech, Blockchain, Web3, DeFi, Morpho, Aave, Compound, Privy, Stripe, Swaps, Vaults, Perpetuals, Non-Custodial Wallets

EDUCATION

Information Systems Engineer | Universidad Nacional del Sur (UNS)

Jan 2020 - Oct 2025 | Bahía Blanca, Argentina | Average grade: 8.67 / 10

Graduated from a 5-year accredited engineering program at one of Argentina's top-ranked public universities: **#10 nationally** in the 2026 SCImago Institutions Rankings and **#8 nationally** across five consecutive CWUR editions (2020-2024). Completed 34/34 courses, an **8.67/10 average**, a **10/10 Final Year Project**, and Supervised Professional Practice. Relevant coursework: Artificial Intelligence Systems, Systems Architecture & Design, Databases, Software Verification & Validation, Algorithms & Complexity, and Formal Methods for Software Engineering.

SELECTED PROJECT

Filomena · Production Exam Platform for Health Sciences

Jan 2025 - Dec 2025

Principal author and contributor in a three-person team building a production platform active at **5 Argentine national institutions**; Final Year Project graded **10/10**.

- **Led architecture, backend, frontend, and infrastructure**, modernizing a CakePHP + jQuery monolith into an API-first product with a Laravel REST API and Next.js/React/TypeScript frontend.
- **Supported 1,000+ simultaneous users observed in production** with complete consistency and critical endpoints below **300 ms on average** through SQL tuning, Redis caching and queues.
- **Reduced institutional onboarding from hours to minutes** with production Docker/GitHub Actions deployments observed below **15 minutes**.
- **Implemented production security and observability** with Prometheus/Grafana, multi-role RBAC, student anonymity and per-institution data isolation.
- **Coordinated Agile delivery** from requirements through production.
