PROFESSIONAL SUMMARY

AI Software Engineer and Information Systems Engineer from UNS. I build production AI products with agents, RAG, and Python/FastAPI services connected to web and mobile experiences. I combine product development with architecture, evaluation, and operations, grounded in TypeScript/React, Java/Spring Boot, distributed systems, and AWS. My experience includes a historical load of **20M+ promotions** and a back office integrating **10+ enterprise systems**.

PROFESSIONAL EXPERIENCE

AI Engineer | Rampy

Sep 2026 – Present | Remote

Production AI product · Analysis, architecture, web/mobile development, evaluation, and operations in direct collaboration with three founders.

- **Enabled a consolidated portfolio view with 24-hour performance** through parallel provider calls, result aggregation, selective Redis caching, and Celery tasks to accelerate asset and vault queries.
- **Improved RAG, memory, and tool selection** through automated flow evaluations and controls against malicious instructions; removing redundant queries yielded an estimated **30% reduction in tokens associated with unnecessary queries**.
- **Integrated Morpho, Aave, and Compound end to end** for positions, yields, deposits, and withdrawals across backend, frontend, and transaction execution, with completeness checks and webhook-based status tracking.
- **Refactored the product around hexagonal architecture and a design system** to reuse components; developed React Native/Kotlin features and validated them through automated tests, emulators, and real devices.
- **Cut validation, build, and deployment from approximately 1 hour to 10 minutes** while retaining checks and optimizing the bundle; operated containers, databases, monitoring, and backups on DigitalOcean.
- **Automated local setup with Makefile and Infisical** and a reusable development-agent skills catalog, standardizing environments, per-user access, and secrets synchronization with on-demand rotation.

Software Engineer | Teamcubation

Dec 2025 – Aug 2026 | Argentina · Remote

Payway promotions platform — contributed as a key engineering team member to a complete historical load of **20M+ promotions in production** and the ingestion of thousands of new promotions per day, within an ecosystem of 350,000+ merchants, 70+ card issuers, and 13 countries.

- **Delivered the promotions experience end to end**: integrated a Single-SPA React/TypeScript microfrontend through a Spring WebFlux BFF and used Amazon API Gateway to bridge the HTTPS merchant portal with internal HTTP services.
- **Built Java/Spring Boot and TypeScript/Node.js/NestJS microservices** using hexagonal or layered architecture, and developed and diagnosed containerized workloads running in Docker/Kubernetes-managed environments.
- **Implemented event-driven processing** with S3, SQS, and a Python/FastAPI Lambda for the historical load; built Python/Node.js tooling to reproduce local loads, reconcile results, and identify failed promotions.
- **Designed a merchant-facing RAG assistant** with Python, LangChain, LangGraph, PostgreSQL/pgvector, and guardrails for active/expired promotions and statistics, without executing commercial actions.
- **Created a custom agentic engineering workspace** for the product's multi-repository integration landscape to streamline context retrieval, token usage, and consistent feature delivery.

AI Engineer & Full-Stack Developer | Self Employed

Jan 2024 – Present | Argentina · Remote

Independent Product Engineering · Revenue-generating products, internal operations systems, and AI automation for e-commerce, social media, and digital-product clients.

- **Designed and shipped digital products**, back offices, and stock/point-of-sale extensions that generated **USD 10,000+ in cumulative client profit**, connecting commercial needs with maintainable, scalable operations.
- **Built MCP-, Claude-, and LLM-powered pipelines and agents** for end-to-end content research, generation, and publishing; clients estimated operating-cost reductions of at least **70%**.
- **Built stores, APIs, and Python/Node.js automation** using Spec-Driven Development, cutting tasks from hours to minutes. For Pequeverso, delivered a Next.js site on Hostinger and an informational product and shopping assistant.

Software Engineer | Cooperativa Obrera

Dec 2024 – Dec 2025 | Bahía Blanca, Argentina · On-site

Permissions Management System · Principal design, architecture, and implementation of a back office for authorized personnel at an organization with **150+ branches, 2.7M+ members**, and 50+ internal systems.

- **Built a responsive, dynamic Next.js/TypeScript frontend** connected exclusively to a Python/FastAPI BFF, which centralized the back-office contract and decoupled the UI from downstream microservices and integrations.
- **Integrated 10+ systems** through Java/Spring Boot and TypeScript/Node.js/NestJS microservices with a shared permissions contract; built an agentic development workspace to preserve context across repositories.
- **Standardized system onboarding** with reusable structures, filters, and validation, reducing permission-related tickets and manual assignments by at least **80%** and eliminating at least **95%** of recurring assignment bugs, based on before/after tickets and logs.
- **Cut permission searches from approximately 10 minutes to under 10 seconds** through SQL tuning, indexing, and pagination while keeping critical endpoints below **300 ms on average** in qualified tests on enterprise on-premise servers.
- **Implemented LDAP, RBAC, and exportable auditing** to restrict access to authorized personnel; automated Python validation and bulk loads for a MySQL/MariaDB and Redis system subsequently maintained by the web team.

TECHNICAL SKILLS

Applied AI & Agentic Systems: AI Agents, RAG, LangChain, LangGraph, Agno, Mem0, LLM Evaluation, Model Context Protocol (MCP), LLM Integration, Vector Databases, pgvector, AI Guardrails, Structured Outputs, Claude API

Backend & APIs: Spring Boot, FastAPI, NestJS, Spring WebFlux, Spring MVC, Spring Security, Spring Data JPA, Laravel, REST APIs, Microservices, Celery, OpenAPI

Languages & Runtimes: Python, TypeScript, Java, JavaScript, Node.js, SQL, Kotlin, PHP

Frontend & Product UI: React, Next.js, React Native, Design Systems, Single-SPA, Microfrontends

Data & Architecture: PostgreSQL, MySQL, MariaDB, Redis, System Design, Distributed Systems, Hexagonal Architecture, Layered Architecture, MVC, Event-Driven Architecture, SQL Tuning

Cloud & Delivery: DigitalOcean, AWS, AWS Lambda, Amazon API Gateway, Amazon S3, Amazon SQS, Amazon CloudWatch, Serverless, Docker, Kubernetes, GitLab CI/CD, GitHub Actions

Quality, Delivery & Observability: JUnit, Mockito, Jest, SonarQube, OpenTelemetry, Prometheus, Grafana, RBAC, LDAP, Application Security, Infisical, Agile

Fintech & DeFi Integrations: Fintech, Blockchain, Web3, DeFi, Morpho, Aave, Compound

EDUCATION

Information Systems Engineer | Universidad Nacional del Sur (UNS)

Jan 2020 – Oct 2025 | Bahía Blanca, Argentina | Average grade: 8.67 / 10

Graduated from a 5-year accredited engineering program at one of Argentina's top-ranked public universities: **#10 nationally** in the 2026 SCImago Institutions Rankings and **#8 nationally** across five consecutive CWUR editions (2020–2024). Completed 34/34 courses, an **8.67/10 average**, a **10/10 Final Year Project**, and Supervised Professional Practice. Relevant coursework: Artificial Intelligence Systems, Systems Architecture & Design, Databases, Software Verification & Validation, Algorithms & Complexity, and Formal Methods for Software Engineering.

SELECTED PROJECT

Filomena · Production Exam Platform for Health Sciences

Jan 2025 – Dec 2025

Production platform active at **5 Argentine national institutions**; Final Year Project graded **10/10**, built by a three-person team with me as principal author and contributor.

- **Led architecture, backend, frontend, and infrastructure**, modernizing a CakePHP + jQuery monolith into an API-first product with a Laravel REST API and Next.js/React/TypeScript frontend.
- **Supported 1,000+ simultaneous users observed in production** with complete consistency and critical endpoints below **300 ms on average** through SQL tuning, Redis caching and queues.
- **Reduced institutional onboarding from hours to minutes** with production Docker/GitHub Actions deployments observed below **15 minutes**.
- **Implemented production security and observability** with Prometheus/Grafana, multi-role RBAC, student anonymity and per-institution data isolation.
- **Drove the technical contribution and coordinated Agile delivery** with Trello, from requirements through production; the project received interviews and mentions from university authorities and outlets.
